

I Translocation response and contributing cells

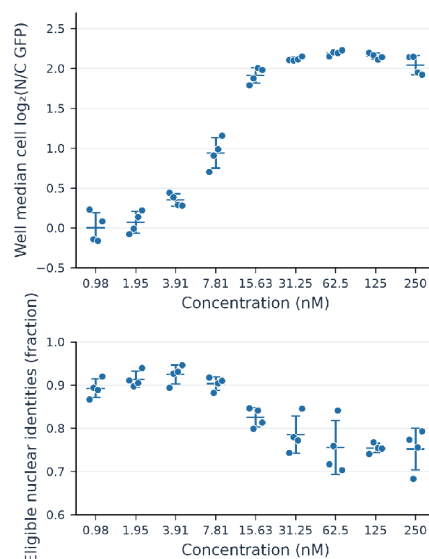

Task-only analysis recovers a dose response

BBBC013 · final self-repaired blind method · 96 paired DNA/GFP wells

A LY294002

B Wortmannin

Dots: four wells per dose. Horizontal marks and whiskers: mean $\pm$ between-well SD.

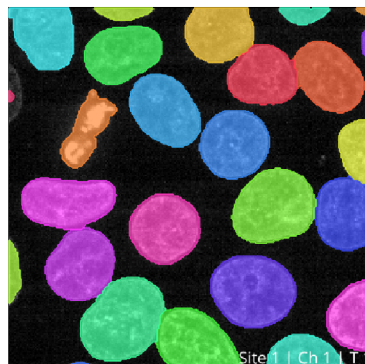

Dose positions are equally spaced; dots offset for visibility. Lower panels use the same wells.

Response is conditional on eligible compartments; not calibrated potency or mask accuracy.

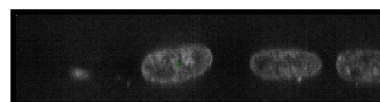

II Three-dimensional nuclear localisation

Measurement-first autonomous 3D localisation

A XY: saved nuclear ROIs + raw

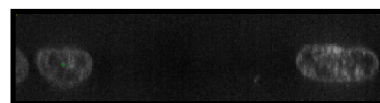

B XZ: ordinary-body centre

Y = 157 voxels

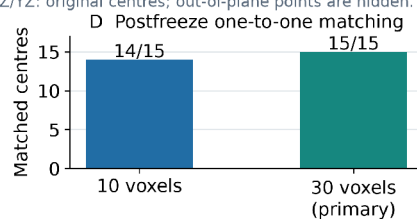

C YZ: ordinary-body centre

X = 80 voxels

XY: same-run nuclear ROI extents, not validated cell borders.

XZ/YZ: original centres; out-of-plane points are hidden.

26 candidate centres

Mean matched error: 4.80 voxels

11 predictions unmatched to annotations

Annotation completeness is unestablished;
unmatched does not mean biologically false
