

One function declaration reaches the whole workflow

A Register a function with typed parameters

```
from openhcs.core.memory import numpy

@numpy
def paper_rescale_signal(image, gain: float=1.2, offset: float=0.0):
    return image * gain + offset
```

Source excerpt; parameter descriptions come from its docstring

B Select the registered function in the existing editor

paper_rescale_signal	openhcs.processing.custom_functions	openhcs
----------------------	-------------------------------------	---------

Selected catalog entry (native UI detail)

C Generated parameter controls

paper_rescale_signal ? ✓ Reset

Gain: ? 1.2

Offset: ? 0

D The same parameters through MCP

openhcs:paper_rescale_signal

gain: float = 1.2
Multiplicative intensity scale.

offset: float = 0.0
Constant added after scaling.

Use the registered function in ordinary pipeline steps
